Statement

D1, which is the prior-art-cited-document most closely related to the present invention, discloses a system where a mobile device is used as an information service provider. Thereby it is possible for a client somewhere on the Web to obtain information about the current context a mobile device is in. A web server with a homepage is running inside a mobile device, and the mobile web server can be accessed by mobile or static clients. This web server is used to enhance Web pages dynamically with context related information for the mobile device and brings the virtual presence of a user near the physical presence. In D1, page 3, is illustrated an example of what a context related mobile homepage template can look like.

The difference between the present invention and D1, is that in the present invention the mobile phone automatically detects the context information, whereas in D1 it seems as if the context information (such as the user being in a meeting) is manually provided by the user of the mobile phone. Therefore, what is claimed in claims 1-24 is novel and considered to involve an inventive step.
